

KARTHIK M

Python Full Stack Developer (Django)

karthikanban912@gmail.com | 6383075553 | Coimbatore, Tamil Nadu, India | devwithkarthik.github.io | linkedin.com/in/karthik912 |

PROFESSIONAL SUMMARY

Python Full Stack Developer (Django) with hands-on experience building production-style web applications using Python, Django, Django REST Framework, React, and MySQL. Developed end-to-end solutions including a freelance FinTech credit-card payment platform, a role-based E-Commerce marketplace, and an ERP Management System with secure authentication, REST APIs, and role-based access control. Brings 3.4 years of enterprise software delivery experience at Wipro Technologies in the Banking and Finance domain, working with HTML5, CSS3, JavaScript, REST API integration, Agile/Scrum, and production support. Passionate about building secure, scalable web applications and seeking a Junior/Associate Python Full Stack (Django) Developer role.

TECHNICAL SKILLS

Backend: Python, Django, Django REST Framework (DRF), REST APIs, Django ORM, JWT Authentication, CBVs, Serializers, Middleware

Frontend: React.js (Components, Hooks, State Management), HTML5, CSS3, Bootstrap 5, JavaScript (ES6+), Responsive Design

Database: MySQL, Relational Schema Design, ORM Queries, Migrations

Tools & Testing: Git, GitHub, VS Code, Postman (API Testing), JIRA, ServiceNow, Vite, Vercel

Concepts: Agile/Scrum, MVC/MVT Architecture, RBAC, API Integration, CRUD, KYC Workflows, Incident Management, SLA Compliance

PROFESSIONAL EXPERIENCE

Frontend Developer — Wipro Technologies, Bangalore, India

May 2022 – Aug 2025

Banking & Finance Domain | HTML5 · CSS3 · JavaScript · Bootstrap · ServiceNow · JIRA · Agile/Scrum

Project 1: Banking Domain Application

- Developed and maintained responsive UI components using HTML5, CSS3, JavaScript (ES6+), and Bootstrap for a banking application handling policy management, customer data, and financial transactions.
- Worked on ServiceNow — handling incidents, RITMs, and change requests (CRs) with SLA compliance; integrated frontend with backend REST APIs to fetch and update live data.
- Automated finance-related report generation, reducing recurring manual effort for the operations team; fixed UI bugs based on client feedback and UAT outcomes.

Project 2: Finance Management System

- Built and enhanced UI screens for financial data visualisation and reporting dashboards on an internal finance system managing data, reporting, and operational workflows.
- Handled ServiceNow incidents, service requests, and change implementations end-to-end; performed root cause analysis on production issues and delivered permanent fixes.
- Conducted pre-deployment testing and validation ensuring zero regression; coordinated with clients to gather requirements and deliver solutions within committed sprint timelines.

PROJECTS

Secure Credit Card Payment Platform (Freelance Client Project) | React · Vite · Tailwind CSS · Django REST Framework · MySQL · Postman

Context: A fintech platform enabling users to move credit card funds to beneficiaries, family/friends, and worker salary payouts, and to transfer credit card funds to debit cards — with KYC verification, a wallet feature, and full payment history tracking.

Problem: How do you build a secure, API-ready payments UI and backend that safely handles sensitive card data, verifies user identity, and gives operations staff full visibility without ever exposing card numbers, CVV, PIN, or OTP?

Approach: Built a 100% React (Vite + Tailwind CSS) frontend with a component-driven architecture — public marketing pages, an authenticated user dashboard, and a separate Admin Operations Console, connected through React Router. Backend REST APIs built with Django REST Framework, tested end-to-end with Postman.

Key technical decisions:

- Implemented KYC verification workflows (Aadhaar, PAN, DigiLocker integration) with status tracking across Verified/Pending/Failed/Manual Review states.
- Built a New Payment flow supporting beneficiary selection, payment purpose categorisation (Personal, Family, Salary, Others), linked-card selection, and a confirmation summary.
- Designed an Admin Operations Console covering user management, KYC monitoring, fee configuration (fixed/percentage pricing, GST), and PDF/Excel report exports — kept on a separate enterprise design system from the customer-facing app.
- Enforced frontend security principles throughout: masked card numbers only, no CVV/PIN/OTP display, protected routes, client-side validation, and secure session handling.

Outcome: A production-style, security-conscious fintech platform demonstrating end-to-end ownership of a React frontend and Django REST backend on a real client engagement — in progress.

Smart E-Commerce Platform — Role-Based Marketplace System | Python · Django · DRF · MySQL · JWT · HTML · CSS · Bootstrap · JavaScript · Git

Context: Built to simulate a real-world multi-vendor marketplace where customers, sellers, and delivery partners each operate with separate workflows, dashboards, and access controls.

Problem: How do you architect a single Django application that serves 3 completely different user types securely, without mixing their data, permissions, or workflows?

Approach: Designed a modular multi-app Django architecture (catalog, cart, orders, users, delivery) with JWT-based authentication and RBAC to isolate each role. Built REST APIs with DRF covering cart management, order lifecycle, inventory updates, and user operations, on a fully normalised MySQL schema via Django ORM.

- Implemented dynamic product variant management (colour, size, RAM, storage) with real-time inventory stock control and automated price calculations — preventing overselling at the database level.
- Built session-based shopping cart and order checkout with automated inventory deduction on order confirmation, ensuring data consistency across concurrent user sessions.
- Applied Django middleware, serializers, and class-based views (CBVs) to enforce clean separation of concerns across the application.
- Deployed live on PythonAnywhere with WSGI configuration, environment-based settings, and static file handling.

Outcome: Fully functional 3-role marketplace demonstrating end-to-end full-stack ownership — from schema design and REST API development to responsive frontend integration and live deployment.

MCK Constructions ERP System — Role-Based Enterprise Management | Python · Django · MVT · JWT · MySQL · HTML · CSS · Bootstrap · JavaScript · Git

Context: Construction companies manage HR recruitment, finance, and project tracking across departments with different data needs and access levels — simulating a real enterprise workflow in one integrated system.

Problem: How do you build a modular ERP where Admin, HR, Finance, and Project Management roles each see only their relevant data — without building four separate applications?

Approach: Designed a single Django application with RBAC supporting four distinct roles, each business domain as a separate Django app under a unified access control layer, using Django ORM for cross-module relational data in MySQL.

- Implemented a 5-stage HR recruitment pipeline with automated stage progression (Applied → Screened → Interviewed → Selected → Onboarded) and decision tracking at each stage.
- Built a financial module with real-time income/expense tracking and dynamic profit calculation using Django ORM aggregation queries — replacing manual spreadsheet reporting.
- Developed a project tracking system with task-based progress monitoring and dynamic completion percentage logic for live delivery visibility.

Outcome: Fully integrated, role-aware ERP simulating real enterprise workflows — modular architecture, multi-role data isolation, and business-critical logic built independently from scratch.

-C4Tech GSMArena-Inspired Django Web Application | Python · Django · MySQL

- Built a server-side rendered multi-app Django application (device listing, brand management, spec views) with template inheritance and full CRUD via Django ORM, including filtered and ordered query sets.

TRAINING

Python Full-Stack Developer Course (6 Months) — SDLC Skill Development Learning Centre, Coimbatore | 2025–2026

- Intensive program covering Python (core to advanced), Django (MVT, CBVs, middleware, serializers), DRF, MySQL schema design, frontend integration, Git/GitHub, API testing with Postman, and live deployment on PythonAnywhere.
- Built and deployed multiple full-stack applications with authentication, CRUD functionality, and normalised relational database design.

EDUCATION

B.E., Electrical and Electronics Engineering — Erode Sengunthar Engineering College | 2018–2022

CGPA: 8.02 | IEEE President – EEE Association (2021–2022)

CERTIFICATIONS & AWARDS

- Python Full-Stack Developer Course — SDLC Skill Development Learning Centre, Coimbatore
- Google Generative AI Fundamentals — Google
- Habit Flagbearer Award — Wipro Technologies (Performance Recognition)

LANGUAGES

- Tamil — Native
- English — Proficient
